Residual gravity is a concept arising from the fact that conventional Bouguer gravity maps reflect the superposition of local gravity fields, owing shallow geological structures, upon a regional gravity field caused by deeper geological structures (Griffin, 1949).

Bouguer Gravity Regional and Residual Separation ...

A gravity anomaly is the difference between the observed acceleration of free fall, or gravity, on a planet's surface, and the corresponding value predicted from a model of the planet's gravity field. Typically the model is based on simplifying assumptions, such as that, under its self-gravitation and rotational motion, the planet assumes the figure of an ellipsoid of revolution.

The calculated regional Bouguer anomaly differs noticeably from those obtained by filtering or just isostatic methods. The residual gravity anomaly, obtained by subtraction of the regional components to the measured field, is analyzed in terms of the dominating upper crustal structures.

The Bouguer anomaly is usually separated into components arising from the geological features of interest (residuals) and other components (often termed the regional field. The residual Bouguer anomaly may then be interpreted in terms of the most probable geological causes. An example is shown in Figure 1.
