### Chapter 15 Diuretic Agents

Potassium-sparing diuretic: A diuretic that reduces the exchange of potassium for sodium in the collecting tubule; a drug that increases sodium and reduces potassium excretion. Example: aldosterone antagonists: Uricosuric diuretic: A diuretic that increases uric acid excretion, usually by inhibiting uric acid reabsorption in the proximal tubule.

Agonists and antagonists at these receptors can alter renal function directly and alter the response to the diuretic agents. Prostaglandins are important in maintaining glomerular filtration. When synthesis of prostaglandins is inhibited, for example, by nonsteroidal anti-inflammatory drugs ( Chapter 36 ), the efficacy of most diuretics decreases.

Water and electrolyte excretion may be increased several times over that observed with thiazide diuretics, since loop diuretics inhibit reabsorption of a much greater proportion of filtered sodium than most other diuretic agents. Urinary output is usually dose dependent and related to the magnitude of fluid accumulation.
